

Regulovatelné páky

Technopolymer

TĚLESO PÁKY

Technický polymer na bázi polyamidu (PA) vyztuženého skleněnými vlákny, v barvách Elecolor, matná povrchová úprava.

TLAČÍTKO

Technopolymer v barvách Elecolors, lesklý povrch.

STANDARDNÍ PROVEDENÍ

Upínací prvek s připevňovacím čepem vyrobený z technopolymeru vyztuženého skleněnými vlákny, barva černá, drážkovaná předřazená část pro usnadnění počátečního záběru. Vratná pružina z nerezové oceli AISI 302.

- **ERX-B**: pouzdro z mosazi, slepý závitový otvor.
- **ERX-SST**: pouzdro z nerezové oceli AISI 303, slepý závitový otvor.
- **ERX-p**: závitový čep z pozinkované oceli se zkoseným plochým koncem podle UNI 947 : ISO 4753 (informace v kapitole Technická data).
- **ERX-SST-p**: závitový čep z nerezové oceli AISI 303 se zkoseným plochým koncem podle UNI 947 : ISO 4753 (informace v kapitole Technická data).

VLASTNOSTI A POUŽITÍ

Zvláště vhodné v případech, kdy je úhel otočení páky omezený nedostatkem místa.

Ve srovnání s jinými typy regulovatelných pák s ocelovým připevňovacím šroubem má toto řešení následující výhody:

- zcela izoluje ruce obsluhy od elektrického výboje
- nejsou viditelné žádné ocelové části které by rezivěly
- pohodlnější uvolnění páky.

ODOLNOST PROTI NAMÁHÁNÍ

Regulovatelné páky se obecně používají v případech, kdy je vyžadováno opakované upínání s vysokou četností.

Proto je odolnost proti namáhání páky velmi důležitá (zvláště počet utahovacích cyklů) a to zejména pevnost plastového ozubení, které přenáší sílu z páky na závitové pouzdro nebo závitový čep.

Četné zkoušky prováděné v laboratořích na odpovídajícím zařízení umožňují simulovat nejobtížnější pracovní podmínky. Ukazují, že regulovatelná páka ERX.78 vydrží bez změny více než 100 000 upínacích cyklů při působící síle 490 N (viz. graf).

Volba vhodných materiálů a konstrukce jednotlivých dílů, ze kterých se vyrábí regulovatelné páky ELESa, umožňují dosáhnout při normálních pracovních podmínkách daleko vyšších hodnot odolnosti proti namáhání, než mají běžně používané páky.

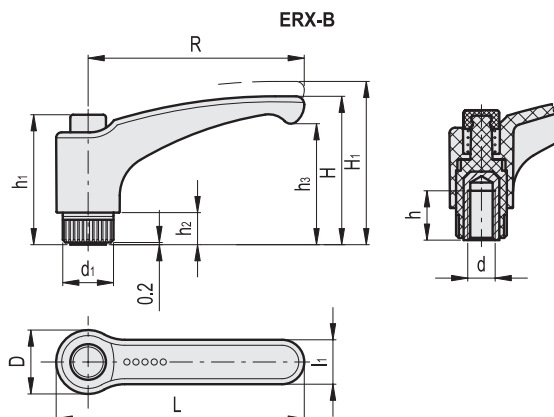

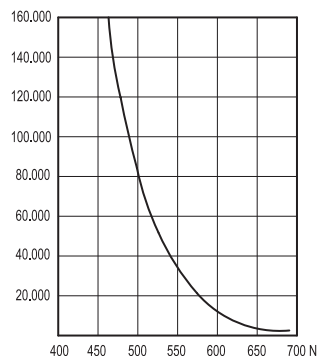

POKYNY PRO POUŽITÍ

Pro přestavení páky během upínání do jiné polohy zvedněte páku tak, aby se uvolnilo ozubení upínacího mechanismu ze záběru a otočte páku do požadované polohy. Po uvolnění páky zasune vratná pružina ozubení automaticky zpátky do záběru.
